

COVID-19 Deaths in the USA

A quick analysis of fatalities across State, Ethnicity/Race
and Age Groups

Arun Mitra
Galvanize SFO-33

The Question:

They say this horrible virus does not discriminate.
America is bearing a terrible toll.
But do we see the toll borne evenly across Americans?

The Data

HealthData.gov

Centers for Disease Control and Prevention
CDC 24/7: Saving Lives, Protecting People™

Deaths data from [Health.gov](https://healthdata.gov)

- COVID19 deaths, by state, by race, by age group : 4,761 rows, 13 columns

Population estimates data from the [Center for Disease Prevention](https://data.cdc.gov)

- Population data (postcensal estimated data for July 1, 2018): 22,000 rows, 6 columns

EDA Issues

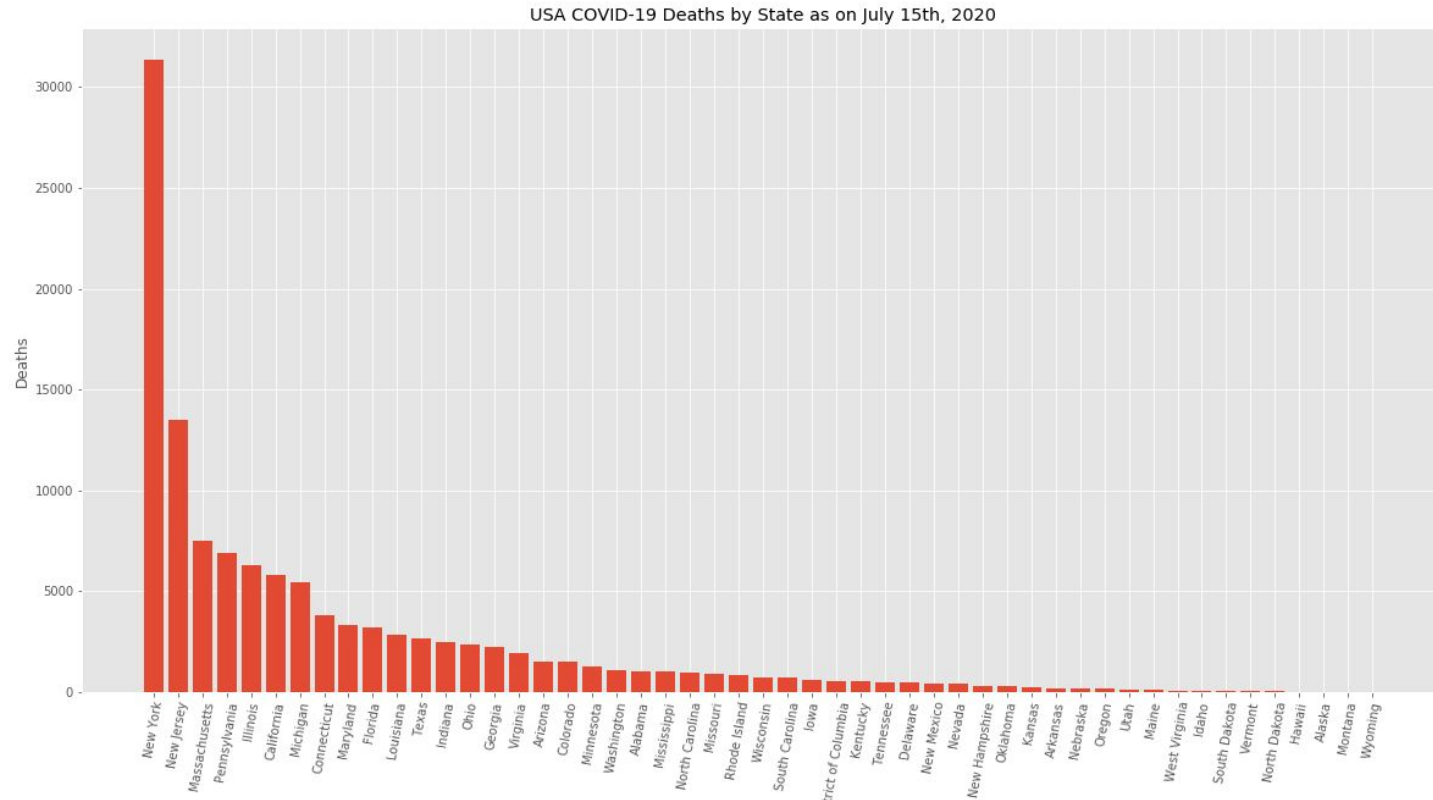

HealthData.gov

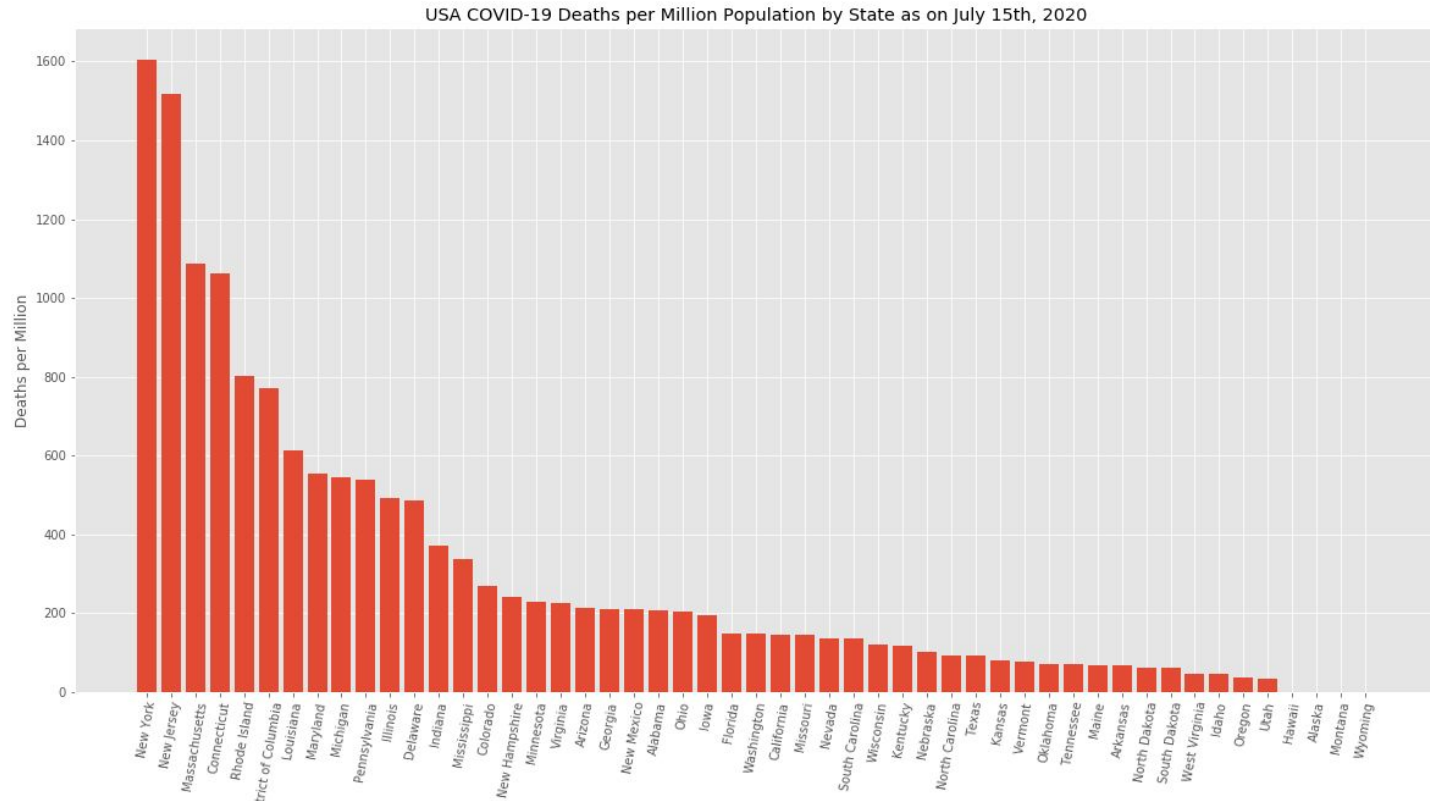

Centers for Disease Control and Prevention
CDC 24/7: Saving Lives, Protecting People™

- Mismatched Ethnicity/Race groupings in the 2 datasets
- Mismatched Age Groups in the 2 datasets
- New York City data included in the states tables (in addition to New York State)
- Little or no valid data for minors (due to confidentiality issues)
- No data for Puerto Rico

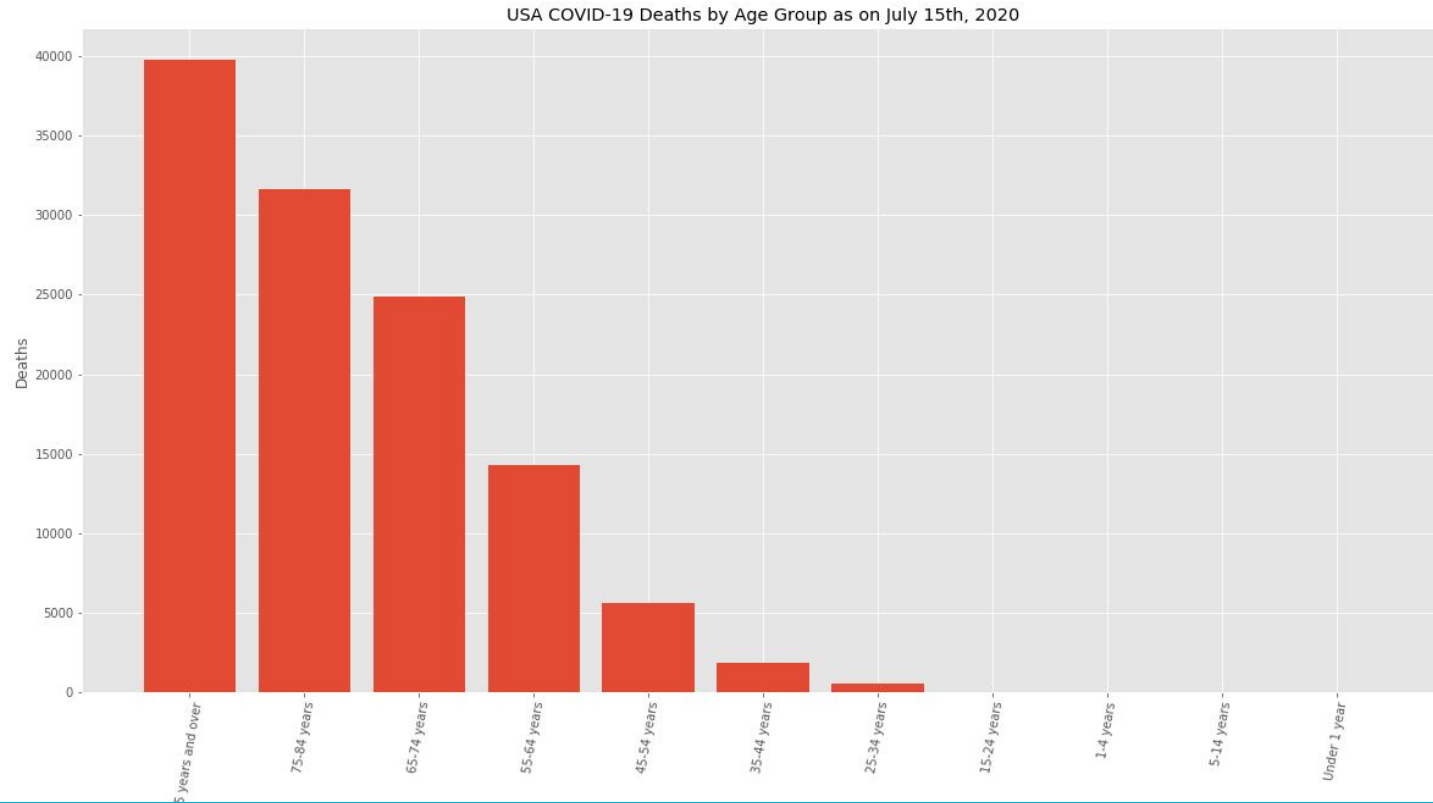

Findings

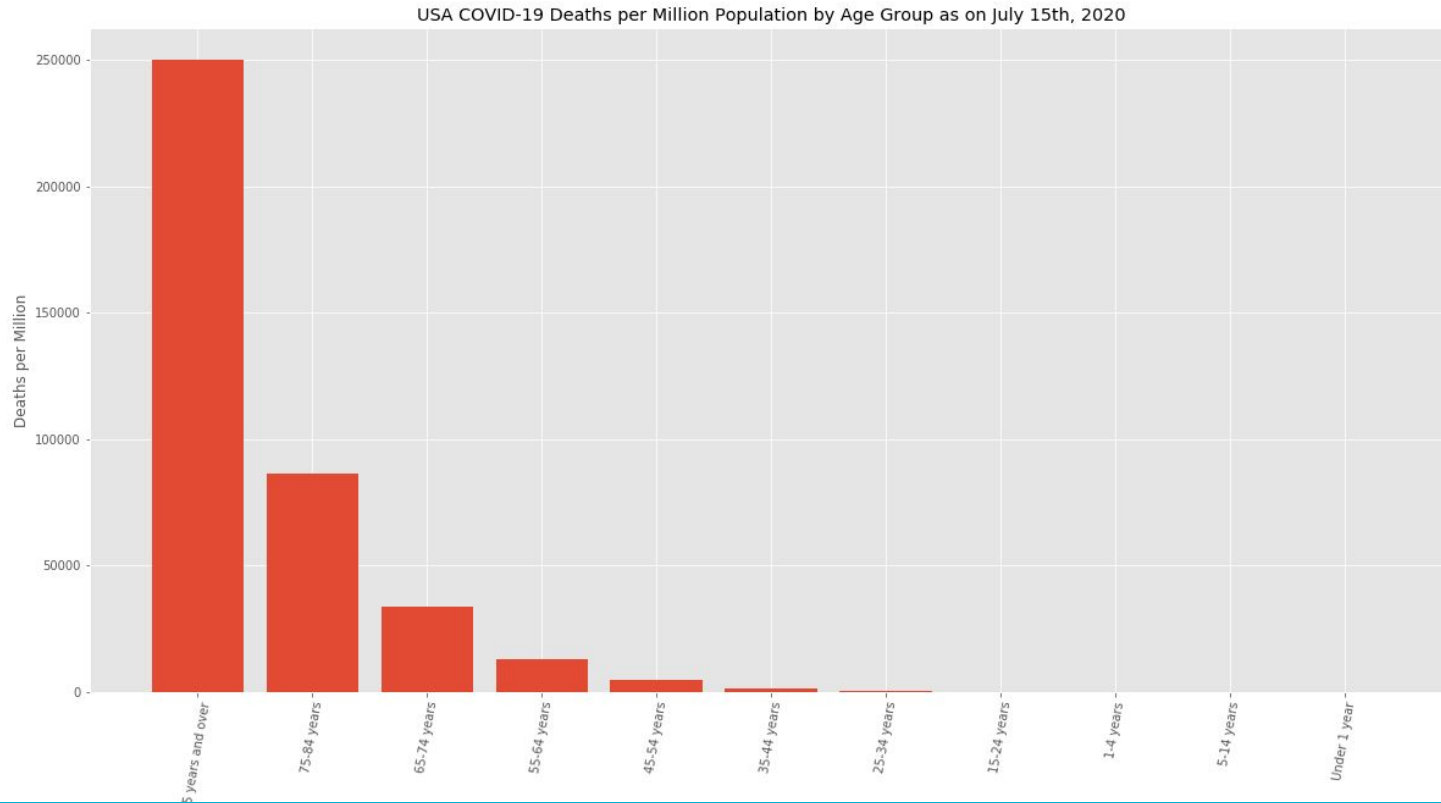

New York, New Jersey and Massachusetts have the biggest fatalities, California is 6th.

New York, New Jersey and Massachusetts also have the biggest fatalities per million, California is 27th.

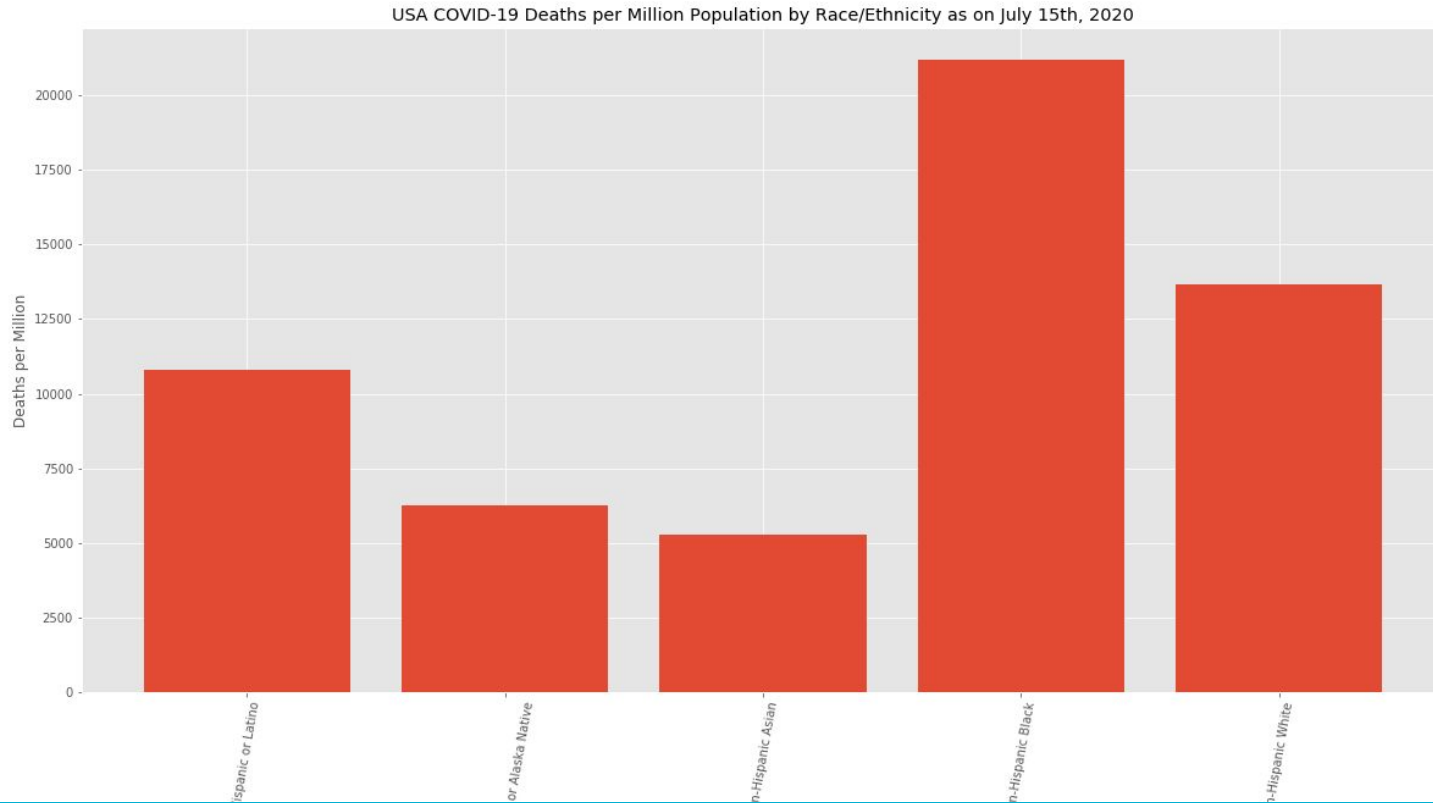

Death toll sloped down steadily across the age groups with Seniors suffering the biggest toll.

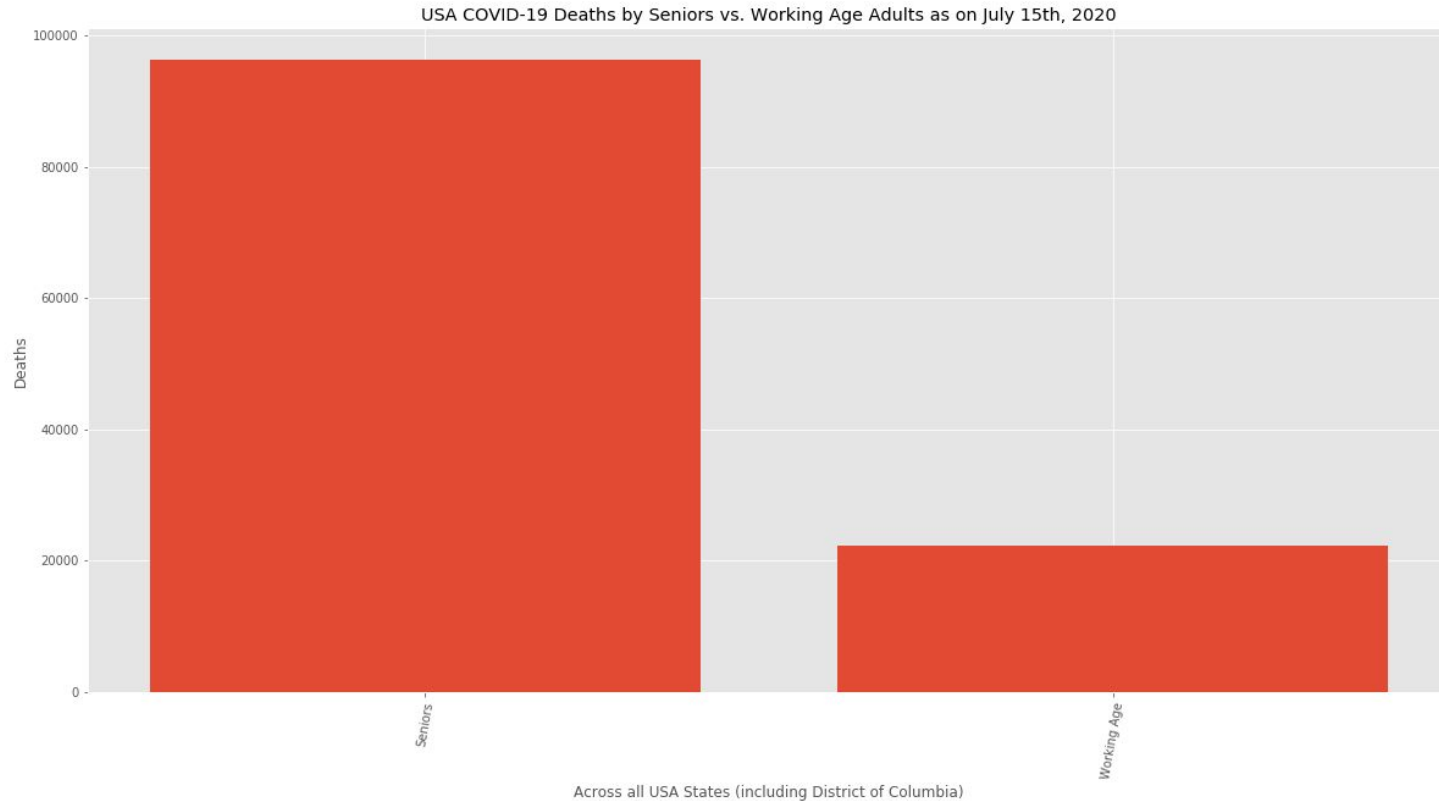

No change for deaths per million. Seniors suffer the biggest toll, even relative to their population.

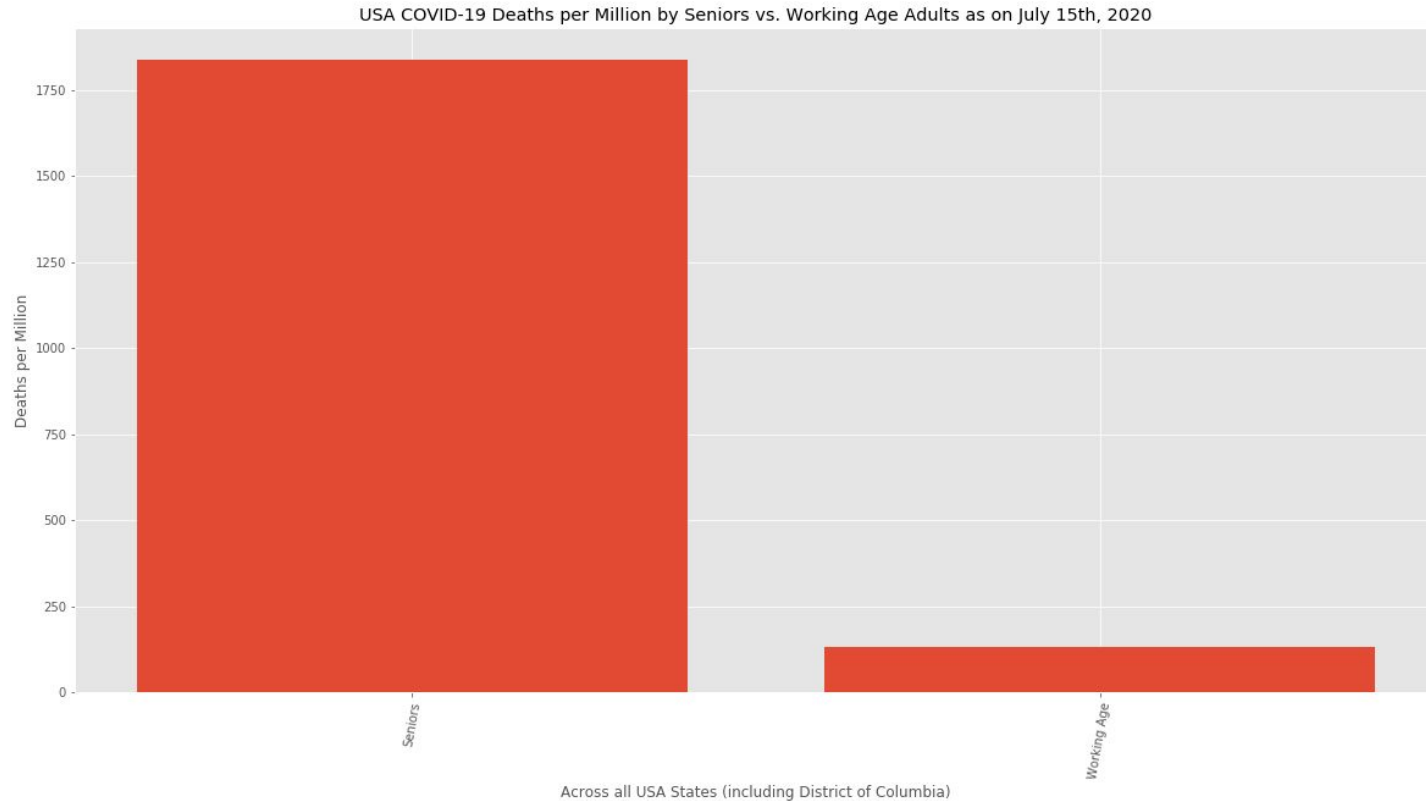

Whites paid the biggest toll in absolute number of deaths. Blacks, Hispanic/Latinos, Asians and American Indians / Alaskan Natives followed in that order.

Per million, the order was Blacks (by far), Whites, Hispanics/Latinos, American Indians / Alaskan Natives, and Asians follow in that order.

Comparing working age adults (25-64) to seniors (65+), America's seniors have paid a terrible price!

Normalized to per million, the story of America's seniors is grim!

Hypotheses Tested

- Null Hypothesis: There is no difference in COVID-19 fatality rates between Blacks and Whites in the USA
 - z-test p-value = 0 : Null Hypothesis Rejected
 - Means: White fatality per million: 3,654.45 / Black fatality per million: 21,176.30
- Null Hypothesis: There is no difference in COVID-19 fatality rates between Hispanics/LatinXs and Whites in the USA
 - z-test p-value = 0 : Null Hypothesis Rejected
 - Means: White fatality per million: 3,654.45 / Hispanic/LatinX fatality per million: 13,654.45
- Null Hypothesis: There is no difference in COVID-19 fatality rates between Blacks and Hispanics/LatinXs in the USA
 - z-test p-value = 0 : Null Hypothesis Rejected
 - Mean: Blacks per Million: 10,808.11 / Mean: Hispanic/LatinX per Million: 13,654.45
- Null Hypothesis: There is no difference between COVID-19 fatality rates between Working age adults and Seniors in the USA
 - z-test p-value = 0 : Null Hypothesis Rejected
 - Mean: Working Age Adults per Million: 130.43 / Mean: Seniors per Million: 1836.92

Looking ahead:

With the recent spikes in so many states,
is the disproportionate toll on Seniors, Blacks and
Hispanics/LatinXs going to continue?
Or will increased public awareness and government
understanding of the above trends change anything?
